

G1000

***Automatic Ink
Quality System***

G1000 IQS

The **G1000** has been developed to keep ink quality stable during the printing process and to reduce solvent and ink consumption. It is not a simple viscometer, but it is a completely automatic system, equipped with viscosity and temperature control, magnetic filter, sophisticated production controls and customized for each rotogravure machine.

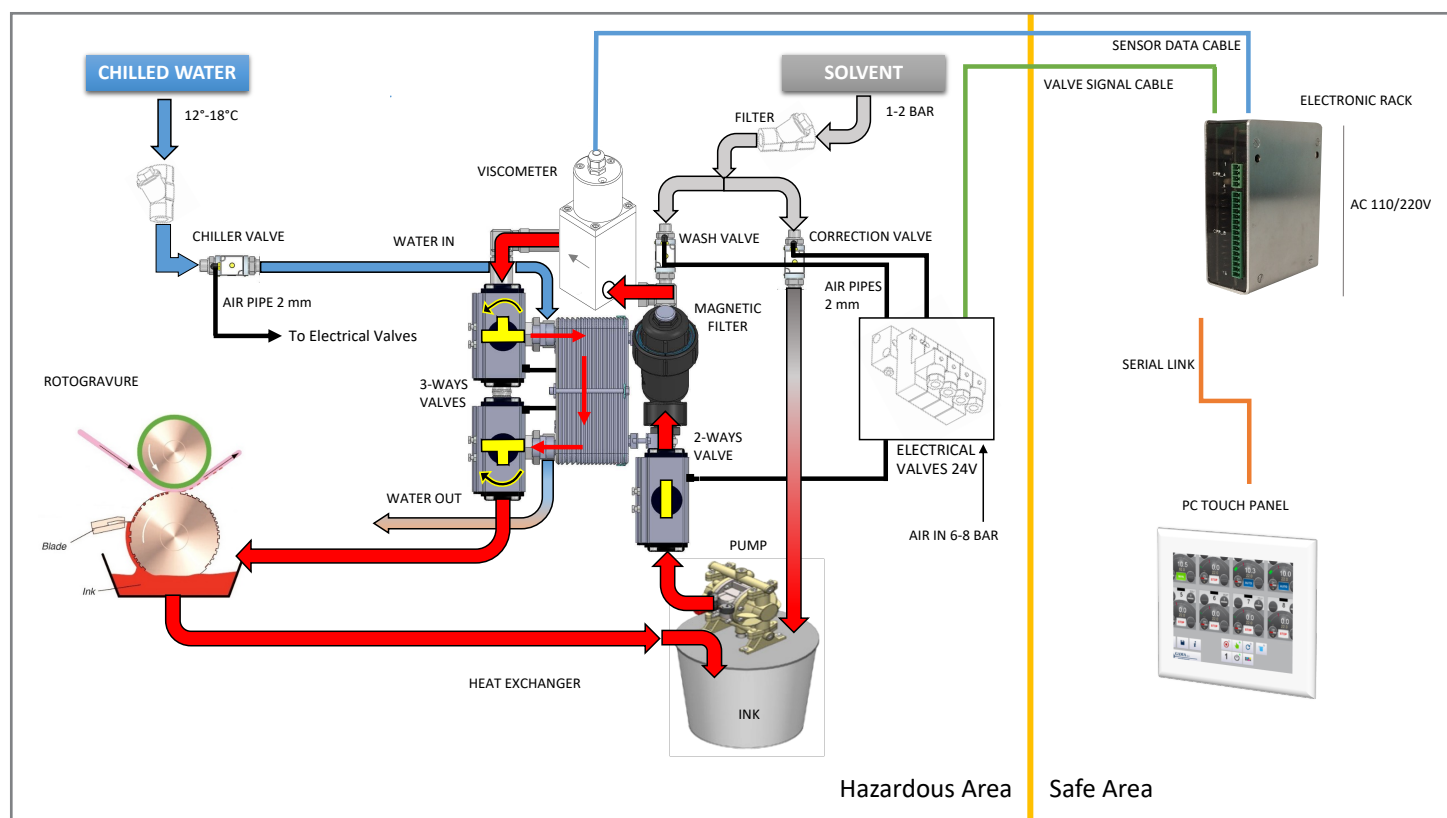

This new system displays several advantages: the viscosity and temperature control of inks reduces the use of ink itself and of solvent, and it allows quicker start-ups and waste reduction. Furthermore, it reduces ink blade lines, thanks to the magnetic filter which attracts steel filings. All those features help making the printing process more productive and efficient.

VISCOMETER FOR SOLVENT AND WATER BASED INK

MAGNETIC FILTER

HEAT EXCHANGER UNIT

OPTION: pH CONTROL
